

**Amendments to the Specification:**

Please replace paragraph [0019] with the following amended paragraph:

[0019] FIG. 3 shows a second embodiment of the invention. Here the blade body 2' is arranged as an annular part supplied with at least one concentric groove 10 located between the inner and outer periphery. The inner periphery is arranged as a V-shaped surface 12 for the drive of the saw blade 1'. This saw blade 1' can be used in a so called ring-cutter machine. As it has no center shaft very deep cuts can be made with this machine. It enables the operator to cut through a concrete wall from one side. This is of course of vital importance during an earthquake rescue operation.
